## AMENDMENTS

## In the Claims:

- (Currently amended) A solid polymer film comprising a polymer comprising:
  - 5 to 40 mole percent of protonated amine monomer units, wherein said protonation is formed by a fixed acid; and
    - at least 60 mole percent of hydrophobic monomer units,
  - wherein water solubility of the polymer film is triggered by a change in pH, salt or surfactant concentration, or both,
    - wherein the polymer film has a thickness of 1 to 5 mil.
- (Original) The polymer film of claim 1 wherein said hydrophobe monomer units comprise non-protonated amine monomer units.
- 3. (Canceled)
- (Original) The polymer film of claim 1 comprising from 5 to 100 mole percent of at least one amine monomer, including both protonated and non-protonated amines.
- (Original) The polymer film of claim 4 comprising from 10 to 40 mole percent of at least one amine monomer, including both protonated and non-protonated amines.
- (Original) The polymer film of claim 5 comprising from 10 to 20 mole percent of at least one amine monomer, including both protonated and non-protonated amines.
- (Original) The polymer film of claim 1 wherein said fixed acid comprises at least one monofunctional acid.

- 8. (Previously presented) The polymer film of claim 1 wherein said hydrophobic monomer comprises (meth)acrylates, maleates, (meth)acrylamides, vinyl esters, itaconates, styrenics, unsaturated hydrocarbons and acrylonitrile, nitrogen functional monomers, vinyl esters, alcohol functional monomers, unsaturated hydrocarbons, and C<sub>8</sub>-C<sub>22</sub> alkoxylated (meth)acrylates.
- (Original) The polymer film of claim 8 wherein said hydrophobic monomers comprise
  methyl methacrylate, ethyl acrylate, and butyl acrylate.
- 10. (Original) The polymer film of claim 1 comprising from 60 to 98 mole percent of said hydrophobic monomer units.
- 11-21. (Canceled)
